Data Viz Best Practices

Shaffer's Four C's:

What's a Dash App?

Dash Apps are accessible to end-users and enable consumption of data & analytics

Dash Apps run custom computations and models on-the-fly

Dash Apps enable customization in the UI that is onerous or impossible to achieve in point-and-click tools

Dash Apps can be built in days by a single data scientist instead of months by a traditional full-stack IT team

Dash App Structure

- Python libraries
- Read data into the app
- App Layout with Dash components
- Callback
- Run app

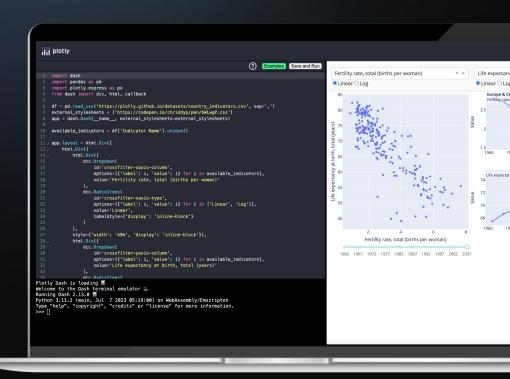

Minimal Dash App Example

```
from dash import Dash, dcc, callback, Output, Input
import dash bootstrap components as dbc
app = Dash()
app.layout = [
   dcc.Markdown(children='', id='myoutput'),
    dcc.Input(value='Type Text', id='mytext')
@callback(
    Output ('myoutput', component property='children'),
    Input('mytext', component property='value')
def update graph(el texto):
    return el texto
            == ' main ':
    name
    app.run (debug=True)
```

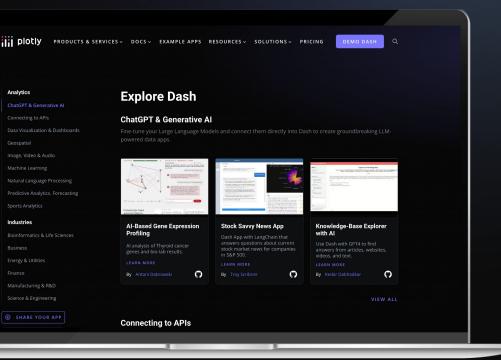

Dash App with Graph and Data

Dash in 20 example

Dash Enterprise and Resource List

- Built-in, configurable authentication
- Industry-standard data encryption
- Data source Integration, linking Dash apps to major back-end data sources like Databricks, Snowflake and dothers
- List of Resources
